Pressure Switches for Process Applications

General Instructions

These instructions provide information for electrical connection, installation, process connection, and calibration. If the switch is a pivot seal sensor type (piston 2 or 3), it is recommended for high-pressure fluid power applications where high-shock pressure and high-cycle rates are expected. Pivot seal sensors are designed specifically for those applications.

NOTE: If you suspect that a product is defective, contact the factory or the SOR® Representative in your area for a return authorization number (RMA). This product should only be installed by trained and competent personnel.

Electrical Connection

*CAUTION*

Electrical Power must be disconnected from explosion-proof models before the cover is removed. Failure to do so could result in severe personal injury or substantial plant damage.

Design and specifications are subject to change without notice. For latest revision, go to SORInc.com

**Wire Lead Color Code**

**SPDT**

- Blue (C)
- Black (NO)
- Red (NC)
- Green (GND)

**DPDT (2-SPDT)**

- Blue (C)
- Black (NO)
- Red (NC)
- Yellow (C2)
- Brown (NO2)
- Orange (NC2)
- Green (GND)

**Vacuum Switch**

Wiring Schematics for Switching Elements in Compound Vacuum-Pressure Switches

- When set point is calibrated to vacuum, use this schematic.
- When set point is calibrated to positive gauge pressure, use this schematic.

**Installation**

1. Secure housing mounting pad to a bulkhead, panel rack or pipe stanchion with two suitable 1/4” bolts.

2. Line mounting by either process connection or electrical conduit connection is not recommended.

3. Suggested mounting orientation is electrical conduit connection at 6 o’clock to prevent condensate from collecting in the housing enclosure. However, the device can be mounted in any position.

Ensure that wiring conforms to all applicable local and national electrical codes and install unit(s) according to relevant national and local safety codes.
**Safety Integrity Level (SIL) Installation Requirements**

The SOR pressure switches have been evaluated as Type-A safety related hardware. To meet the necessary installation requirements for the SIL system, the following information must be utilized:

- Proof Test Interval shall be one year.
- Units may only be installed for use in Low Demand Mode.
- Products have a HFT (Hardware Fault Tolerance) of 0, and were evaluated in a 1oo1 (one out of one) configuration.

**Process Connection**

Securely connect process line to pressure port using two wrenches: one to hold flats on pressure port, the other to tighten process pipe or tube fitting.

*IMPORTANT* Use care not to loosen pressure port from body or body from housing.

*CAUTION* Failure to mount the housing on a flat mounting surface may result in torsional forces on the housing that could cause false trips or render the pressure switch inoperative.

**Calibration**

*Switching Element has been precisely positioned in the housing and overtravel adjusted at the factory for optimum performance. Any inadvertent movement or replacement in the field will degrade performance and could render the device inoperative, unless factory authorized procedures are followed.*

**Fixed Dead Band Models**

Use 3/4” open-end wrench to turn hex adjusting nut clockwise to increase set point; counterclockwise to decrease Set Point. Approximate set point can be obtained by sighting across top of adjusting nut to calibration scale on interior wall of housing. If precise set point calibration is required, it will be necessary to use a regulated pressure source, a suitable continuity tester, and a 1/4% test gauge.

**Adjustable Dead Band Models**

- Decreasing Pressure Set Point - use the fixed dead band procedure (above) to calibrate.
- Increasing Pressure Set Point - can then be adjusted by turning the white thumbwheel on the electrical switching element.
  - Smaller dead band turn wheel clockwise (left to right).
  - Bigger dead band turn wheel counter clockwise (right to left). Bigger dead band may degrade repeatability.

See SOR Catalog (Form 216) for reference dimension drawings. For certified dimension drawings, contact the factory.
NOTE: The unit conforms to the requirements of clause 6.3.12, EN 60079-11: 2007. The unit is capable of withstanding a 500 Vrms isolation test between circuit and enclosure.
EC Declaration of Conformity

For ATEX Certified Models

Product: R Series Pressure Switches
Manufacturer: SOR Inc.
14685 West 105th Street
Lenexa, Kansas 66215-2003
United States of America

Date of Issue: August 11, 2016

We declare that the above products conform to the following specifications and directives:

EN 60079-0: 2012
EN 60079-11: 2012

Carries the marking:
II 2 G Ex ia IIC T6...T4 Gb
T6 (-40°C ≤ Ta ≤ +75°C)
T5 (-40°C ≤ Ta ≤ +90°C)
T4 (-40°C ≤ Ta ≤ +125°C)

Reference document:
EC-Type Examination Certificate
Baseefa11ATEX0125
Issued February 16, 2012

ATEX Notified Body:
SGS Baseefa (Notified Body No. 1180)
Rockhead Business Park, Staden Lane,
Buxton, Derbyshire SK17 9RZ
United Kingdom
Baseefa Customer Reference No. 1021
