**1200 Series Pressure Regulators**

**SOR® pressure regulators** are durable, high performing instruments that are designed to provide reliable control of pressure in various stages of a flow system. From first cut, high pressure regulation applications to low pressure regulation and air filtration applications, SOR provides high quality instruments to control the process. All of the regulators in this catalog offer customizable spring ranges to enhance the control of their output pressure. NACE compliant options are also available for SOR pressure regulators.
1200 Series Pressure Regulators

Applications

- Natural Gas instrumentation columns
- Control Valve Automation
- Pneumatic Controllers
- Pneumatic Tooling
- Catalytic Heaters
- Chemical Injection Pumps

In this case the 1201HPR High Pressure Regulator is taking the high pressure natural gas coming off of the well by tapping into the main line going to the gas processing plant. This reduced pressure is then sent to the pneumatic equipment on the seperator. Compressed air can also be used.

A 1200 Series Pressure Regulator takes the still relatively high pressure gas from the 1201HPR High Pressure Regulator and reduces it once again to an even lower pressure (<250 psi) that the 1267AFR Air Filter Regulator can handle.

The 1267AFR Air Filter Regulator is used to supply accurate, filtered, pneumatic pressure to a liquid level controller. When the level set point is met, the level controller then sends the pneumatic air to a control valve to dump the liquid.
The 1201HPR High Pressure Regulator is designed to provide pressure control in numerous processes that involve a high-pressure drop. It is an extremely durable regulator capable of handling a max inlet pressure of 5000 psi (345 bar). The spring configuration of the 1201HPR can be configured to provide five different outlet pressures ranging from 0-30 psi (0-2.1 bar) to 0-255 psi (0-15.5 bar).

Features
- 3 outlet ports able to send reduced pressure to 3 separate pneumatically controlled devices
- Tamper resistant adjustment screw or T-handle adjustment screw available
- Seat block contains four seats - if sealing poorly, simply rotate the block for a new elastomer seat
- Warranty - 1 year

* Cv value is a theoretical value obtained from calculations using ISA-75 01.01-2007 standard. Please contact the factory for more information.
Principles of Operation
Directly operated, the 1201HPR registers downstream pressure through the body, to the underside of the diaphragm. The disk is forced towards the orifice when downstream pressure is at or above the set pressure of the regulator, and less media flows through the regulator. When the downstream pressure decreases (as demand for the media increases), the regulator spring is able to extend, moving the disk assembly away from the orifice. Media is then allowed to flow through the regulator at a higher rate, until the downstream pressure once again reaches the set point. After the set point is reached, the downstream pressure pushes the disk assembly back towards the orifice, thus reducing flow through the regulator once more.

How to Order
Below is the SOR quick select model number tree that provides you with all the options to configure and order a product for your application. You must select a designator for each component.

**Dimensions** Dimensions shown are for reference only. Linear = mm/in.
The 1267AFR Air Filter Regulator is designed to provide clean, accurate air pressure to instruments, valves, and other automatic control equipment in a lightweight, compact housing. These quality instruments are constructed of durable materials that will provide long lasting performance in industrial environments. The 1267AFR is designed for use in systems that require clean, accurate instrument air. The 1267AFR provides pressure regulation and filtration in an integral compact package. Available in ¼" NPT porting for normal operation and ½" NPT porting for high flow capacity requirements.

### Features
- Compact and light weight construction
- Mounts where competitive units won’t
- ¼" NPT version
- ½" NPT version for High flow capacity
- Low air consumption lower operating costs
- Tapped exhaust option
- Rugged, corrosion resistant design functional for harsh conditions
- Warranty - 18 months
- NACE option available for ¼" NPT version

### Effect of Supply Pressure Variation
- Less than 0.25 psi (0.017 bar) for 25 psi (1.7 bar) change
- Less than 0.5 psi (0.035 bar) for 25 psi (1.7 bar) change

### Temperature Limits
0° to 160° F (-18° C to 71° C)

### Weight
1.2 lbs (.45 kg)

### Operating Media
Air, Inert Gas and Sweet Natural Gas

### Materials of Construction
- **Standard**
  - Body: Diecast Aluminum Alloy, Irridite & Baked Epoxy Finish
  - Filter: Polyethylene
  - Diaphragm: Nitrile Elastomer & Nylon Fabric
  - Valve Seat: Nitrile Elastomer
  - Additional Materials: Brass, Zinc Plated Steel, Acetal
- **NACE**
  - Plated Steel, Aluminum, Heat Treated Plated Steel

1200 Series
Pressure Regulators 1267AFR

Principles of Operation
 Turning the adjusting screw changes the force exerted by the range spring on the diaphragm assembly. In equilibrium of set pressure, the force exerted by the range spring is balanced by the force from the output pressure acting underneath the diaphragm assembly. An unbalanced state between the output pressure and the set pressure causes a corresponding reaction in the diaphragm and supply valve assemblies.

If the output pressure rises above the set pressure, an upward force is exerted on the diaphragm assembly causing the relief seat to lift and open. Excess pressure is vented to atmosphere until equilibrium is reached. If the output pressure drops below the set pressure the unbalanced force of the range spring causes a downward force on the diaphragm assembly. The supply valve then opens until the pressure builds up once more to the equilibrium condition.

Under forward flow conditions, the range spring force is balanced by the diaphragm pressure force, with the supply valve open just enough to maintain the required equilibrium pressure. When high flow occurs, a specially designed aspirator helps maintain downstream pressure and compensates for droop.
