RF Capacitance Level Controls

Features and Benefits

- Reliability
- Low maintenance costs
- No moving parts
- Interface measurement with on/off and continuous output
- Unaffected by changes in pressure, temperature, specific gravity, vapor or density
- Versatile - can be used with both conductive and non-conductive substances. Manages a variety of liquids, granular solids, powders and slurries.
- Dielectric range is unlimited
- 316SS or Teflon® probes
- Can be used in virtually every type of chamber
- Set point/span are completely adjustable
- Withstands temperatures up to 400°F (204°C)
- Withstands pressure up to 2000 psig (138 bar)

Agency Listings/Certification

- Select models with CSA, FM, IECEx and INMETRO
- Meets most code and customer requirements.

RF Capacitance Level Controls

Principle

Operating Principle

RF Capacitance level controls are based on an electronic device called a capacitor. The capacitor is a device that stores energy. This energy is not stored in the probe; rather, the RF Capacitance level control is merely measuring how much energy can be stored. The amount of capacitance the RF Capacitance level control is measuring is extremely small and is measured in picofarads (1×10^{-12} farads).

The capacitor is made up of two conductive plates parallel to each other. Separating the two plates is an insulator.

The amount of energy a capacitor can store is influenced by several things. First, a larger plate area results in more space to store energy. Second, more space between the plates reduces the amount of energy storage. Finally, a higher dielectric constant media can contain more energy than a lower dielectric media. The dielectric is where the actual capacitance is developed. The following chart shows the dielectric constant and conductivity for some sample materials.

Dielectric Constant				
2	6.9	20	50	80 or more
Acetone	Popcorn	Alcohol	Glycerin	Water
Mineral Oil				
Conductivity				
4.8	10	14.6	31.5	60 or more
1.6	5			
Acetone	Popcorn	Alcohol	Glycerin	Water
Mineral Oil				

Substances are considered either conductive or non-conductive. Non-conductive materials have a dielectric less than 10 or a conductivity less than $10 \mu\text{siemens/cm}$. Conductive materials have a dielectric constant greater than 10 or a conductivity greater than $10 \mu\text{siemens/cm}$. Interestingly, there is a similar relationship between dielectric constant and conductivity. Non-conductive substances tend to have low dielectric constants and conductive substances tend to have high dielectric constants.

Non-Conductive Substances

The structure of the capacitor actually changes in a level application. One plate is the probe and the other is the wall of the tank (see following figure). These do not change, nor does the distance between them. The only thing that changes is the dielectric constant. Air has a dielectric constant of one; anything else you measure will have dielectric value greater than one.

When the substance level increases, the dielectric of the substance is replacing the air and causes the capacitance to increase. The preset capacitance value is equal to the set point level wanted and trips a switch when the level is reached. The transmitter creates a linear output in relationship to the capacitance measured.

Conductive Substances

The substance between the two plates has to be an insulator in order to have a capacitor. When a conductive material is between the plates, an electrical short is created. This, in turn, signals the level transmitter to indicate a high level. A Teflon insulator around the sensor will prevent this from happening, as the figure below demonstrates.

An electrical connection is created through the conductive substance from the tank wall and the Teflon probe. When the level in the tank rises, the capacitor is created by the metal probe rod, the substance being measured and the probe insulator (Teflon), where the sensor rod and substance are the plates and insulator is the dielectric. This means that rather than measuring the dielectric of the substance, the dielectric of the probe where it is covered by the substance is being measured.

RF Capacitance Level Controls

Principle

Restrictions of RF

- Sensitive to changes in material dielectric (**Note:** dielectric compensation additives help, but the liquid can stratify.)
- Normally needs field calibration, which requires a change in level
- Dependent on contact with the substance being measured
- Conductive coatings can build up on the sensor and create false readings

The Difference Between RF Capacitance and RF Admittance

Contrary to popular belief, there really isn't an application difference between RF Capacitance and RF Admittance. The only difference is in the electronics; the overall performance of the unit remains the same. That's where the "RF" part comes in, as the following will explain:

RF measurement is actually measuring capacitance, as well as capacitance reactance (impedance). The energy (Radio Frequency) is traveling from one conductive plate to the other. The following equation represents capacitance reactance:

$$X_c = \frac{1}{2\pi fC}$$

where

X_c = Capacitance Reactance (Ohms)

2π = Radians in a 360° cycle of AC (alternating current)

f = Frequency of AC (hertz)

C = Capacitance of system (in farads)

When there is a conductive coating on the probe, a non-RF unit will indicate the level at the top of the coating. By looking at the conductivity, an RF system can reduce the error caused by the coating (see following figure). Consider this: At the actual level, the amount of capacitive reactance (impedance) is low because the space between the tank wall and probe is filled with a conductive liquid. However, at the coating on the probe, there is also a large air space between the probe and tank wall. This air space results in a high amount of capacitive reactance.

The Difference Between RF Capacitance and RF Admittance

Look at the formula for capacitive reactance. Since we are striving to measure the capacitance, C cannot change, and 2π is a constant and cannot change. The only thing left we can change is the frequency. If the frequency is increased (RF), the capacitive reactance decreases.

The level is represented on the vertical axis in these two graphs. Changes in the resistance are represented on the horizontal axis. A vector representing a combination of the two (impedance) is shown to the left. The inverse of this graph is shown below.

As you can see, an “admittance” measurement is just the inverse of a capacitance measurement. The important part, as previously stated, is the “RF”

Use this chart to select the RF instrument that best meets your needs.

651 Single-Point RF Switch

The 651 provides basic, single-point switching for use as an alarm or indicator. It's virtually immune to process coatings on the probe, making it a useful solution for many tough level applications. This immunity, combined with the absence of any moving parts, makes the 651 well suited for applications that are difficult for other technologies.

Features

- Economical point sensing
- Suitable for 12 VDC service
- FM Approved, CSA Certified hazardous locations, IEC Certified
- Field-selectable failsafe

Product Specifications

Input Power - Line	120 VAC, 50/60 Hz 240 VAC, 50/60 Hz 24 VDC 12 VDC	Response Time	0.5 seconds

681 Single-Point RF Switch with Self Test

Available as an integral or remote-mounted unit, the 681 provides single-point switching, and with its many safe and operation features, is well suited for demanding industrial applications.

Its "Self-Check" function constantly monitors circuit and probe integrity. A dedicated relay (line powered) or current shift (loop powered) indicates if the unit is not functioning properly. An optional, adjustable differential provides control of two set points with one relay, which gives the 681 pump and valve control for maintaining correct process levels.

Features

- Continuous self testing (Self-Check) verifies operation of the unit
- Optional adjustable differential for pump/valve control
- Available as integral or remote-mounted
- Field-selectable failsafe
- Resists process media coating

660 Series Multi-Point RF Switch

The 660 Series provides the options of multipoint switching plus narrow and wide differential switching. By combining these features, the 660 Series units can be used for a wide variety of control needs. The available switching combinations are designed to provide multiple alarms, pump/valve control, or a combination of alarms and equipment control. The 660 Series makes it possible to combine up to four singlepoint devices into one package for lower costs and reduced maintenance.

Features

- Up to 4-point indication
- Suitable for 12 VDC service
- FM Approved and CSA Certified for hazardous locations
- Field-selectable failsafe
- Resists process media coating

Switching Combinations

The 660 Series has eight different combinations of fixed differential and/or adjustable differential switching points. Each unit is equipped with one of four discreet switching points. These points can be used to provide true point level sensing with no level differential, or latched together to provide wide, adjustable differential.

See page 11 for available combinations. Required combinations are selected using step 1 in the How to Order chart on page 10.

* Electronics and probe must have the same agency to maintain the listing integrity (i.e. CS or AI electronics with CS probe, or FM or FI electronics with FM probe).

Agency Approval

Agency	Safety Method	Approval	Model(s)	
FM	Explosion Proof	Class I, Groups B, C, D Class II, Groups E, F, G Class III, Division 1	66x-Jx-FM 66x-Jx-FM	
CSA	Explosion Proof	Class I, Groups C, D Class II, Groups E, F, G Class III, Division 1	66x-Jx-CS 66x-Rx-CS	

Connection Cable

Remote units require #22AWG shielded twisted pair cable to connect the control to the probe. The maximum length of this cable is 4000 feet (1219.2m).

A 25 ft. (7.6m) cable is supplied with each unit. Other lengths can be ordered per the information below. The cable glands supplied with the unit must be replaced with suitable fittings when installing conduit.

Series 660 Switching Combinations

670 RF Transmitter

The 670 provides continuous level measurement and a 4-20 mA linear output. It is a high-performance, general-purpose level transmitter that is well suited for many demanding applications that other technologies cannot handle.

Features

- FM Approved, CSA Certified hazardous locations
- Easy calibration
- Electrostatic discharge protection up to 4000 volts
- Resists process media coating

Product Specifications

Selection Guidelines

Selecting the right probe for your application is very important. The objective is to maximize the amount of capacitance change for every inch (cm) of level change. Following are general guidelines for selecting a probe for a particular application. Please consult with SOR® or your local SOR sales representative for additional and/or specific information.

1. If process media is non-conductive - less than 10 μ Siemens/low dielectric (less than 10), select a bare probe. If there is any water in the process, go to number 2.
2. If process media is conductive - greater than 10 μ Siemens/high dielectric (greater than 10), select an insulated probe.
3. If process is non-conductive and in a horizontal (bullet) tank, or if the probe must be mounted more than 12 inches from the vessel wall, select a stilling well, dual-rod or dual-cable probe.
4. If vessel is non-metallic, select a stilling well, dual-rod or dual-cable probe.
5. Use rigid probes for measurement lengths of 10 feet or less. Use cable probes for longer ranges.
6. For agency-listed controls, a matching agency listing must be specific on the probe. Available probe agency listings are provided in the following charts and specification pages.

Rigid Probes - Sheathed

Single Rigid
Sheath Probe

Model Number	Probe Material	Sensor Diameter	Spanned Capacitance in Water	Process Temperature Limits	Weight
CB	Teflon® sheath	5/8" (15.9 mm)	10 pF/in.	-100 to 400°F (-73 to 204°C)	1 lbs. (0.5 kg) +0.7 lb. (0.3 kg) per foot of probe

Rigid Sheath Probe
with Stilling Well

Model Number	Probe Material	Sensor Diameter	Spanned Capacitance in Water	Process Temperature Limits	Weight
CC	Teflon® sheath inside 316SS stilling well	1.05" (26.7 mm)	12 pF/in.	-100 to 400°F (-73 to 204°C)	2 lbs. (0.9 kg) +1.5 lb. (0.7 kg) per foot of probe

Rigid Sheath
Dual Probe

Model Number	Probe Material	Sensor Diameter	Spanned Capacitance in Water	Process Temperature Limits	Process Pressure	Weight
CD	Teflon® sheath and 316SS ground probe	1/2 & 5/8" (12.7 & 15.9 mm)	10 pF/in.	-100 to 400°F (-73 to 204°C)	Pressure per CB probe or flange rating, whichever is lower	12 lbs. (5.5 kg) +1.5 lb. (0.7 kg) per foot of probe

Rigid Probes - Sheathed

Single Inactive
Sheath Probe

Model Number	Probe Material	Sensor Diameter	Spanned Capacitance in Water	Process Temperature Limits	Weight
CJ	Teflon® sheath 316SS sheath	5/8 & 3/4" (15.9 & 19.1 mm)	10 pF/in.	-100 to 400°F (-73 to 204°C)	1 lb. (0.5 kg) +0.7 lb. (0.3 kg) per foot of probe

Rigid Probes - Bare

Single Rigid
Bare Probe

Model Number	Probe Material	Sensor Diameter	Spanned Capacitance in Water	Process Temperature Limits	Weight
CA	316SS	1/2" (12.7 mm)	N/A	-100 to 400°F (-73 to 204°C)	1 lb. (0.5 kg) +0.7 lb. (0.3 kg) per foot of probe

Single Rigid
Bare Probe
with Stilling Well

Model Number	Probe Material	Sensor Diameter	Spanned Capacitance in Water	Process Temperature Limits	Weight
CE	Bare 316SS probe inside 316SS stilling well	1.05" (26.7 mm)	N/A	-100 to 400°F (-73 to 204°C)	2 lbs. (0.9 kg) +1.5 lb. (0.7 kg) per foot of probe

RF Capacitance Level Controls

How to Order

Model Number System

CB C-8A-CS-12-TT

Process Connection		3	4		Agency Approval		
3/4" NPT		8A	00	No Agency Approvals required			
1" NPT (Required size on CC and CE probes)		1A	CS	CSA (not available on CA, CE)*			
1-1/2" NPT		9A	FM	FM (not available on CA, CE)*			
2" NPT		2A	MB	IECEX (not available on CA, CE, CJ)*			
1" 150# ANSI RF Flange		1C	NM	INMETRO (not available on CA, CE, CJ)*			
1-1/2" 150# ANSI RF Flange		9C	<p>* Electronics and probe must have the same agency to maintain the listing integrity (i.e. CS or AI electronics with CS probe, or FM or FI electronics with FM probe).</p>				
2" 150# ANSI RF Flange		2C					
3" 150# ANSI RF Flange		3C					
(3C, 3D, 4C, 4D only on CD & CP probes)							
4" 150# ANSI RF Flange		4C					
1" 300# ANSI RF Flange		1D					
1-1/2" 300# ANSI RF Flange		9D					
2" 300# ANSI RF Flange		2D					
3" 300# ANSI RF Flange		3D					
4" 300# ANSI RF Flange		4D					
Sensor Material		2	5			Sensor Length	
316SS Standard		C	XXX.X		Sensor length in inches. Lengths are 5 places including the decimal and leading zeros (see Accessories for different units). Sensor style CJ requires a sensor length followed by an inactive sheath length. See page 23 for limits of probe length.		
					Note: Inactive sheath length must be at least 6" shorter than sensor length		
Sensor Style		1	6		Accessories & Certificates		
Rigid 316SS Single Probe	CA		FT	Probe length specified in feet (ft.)			
Rigid Teflon Single Probe	CB		MK	Probe length specified in meters (m)			
Rigid Teflon Single Probe with Stilling Well	CC		ML	Probe length specified in centimeters (cm)			
Rigid Teflon Dual Probe (316SS Ground)	CD		PP	Fiber tag with customer-specified information			
Rigid 316SS Single Probe with Stilling Well	CE		RR	SS tag wired on with customer-specified information			
Rigid Teflon Single Probe with 3/4" OD Inactive Sheath	CJ		TT	SS tag riveted on with customer-specified information			
			<u>Individual Certificates</u>				
			C2	Hydrostatic Pressure Test			
			C8	Typical Material of Wetted Parts			
			D1	Certificate of Origin			
		D2	Manufacturer's Certification				
	CB	C	8A	CS	00012	TT	← Model Number

RF Capacitance Level Controls

Agency Approval

Agency	Safety Method	Approval	Model(s)	
FM	Explosion Proof	Class I, Groups B, C, D Class II, Groups E, F, G Class III, Division 1	CB, CC, CD and CJ	
CSA	Explosion Proof	Class I, Groups C, D Class II, Groups E, F, G Class III, Division 1	CB, CC, CD and CJ	
IEC	Intrinsically Safe	Ex ia IIB T4	CB, CC and CD	
INMETRO	Intrinsically Safe	Ex ia IIB T4	CB, CC and CD	

Probe Insertion Lengths

Probe Type	Length (inch)		Length (cm)	
	Minimum	Maximum	Minimum	Maximum
CA	3.5"	234"	8.89	594.4
CB	1.5"	234"	3.81	594.4
CC	2"	234"	5.08	594.4
CD	2"	120"	5.08	304.8
CE	4.5"	234"	5.08	594.4
CJ	7"	120"	17.78	304.8
Sheath*	1"	114"	2.54	289.6

*Sheath length must be selected with CJ only.

Flange Weight and Pressure Rating

Process Connection	Add to Shipping Weight	Maximum Pressure Rating
1C	2 lbs. (1.0 kg)	275 psig (19 bar)
9C	4 lbs. (1.8 kg)	275 psig (19 bar)
2C	5 lbs. (2.3 kg)	275 psig (19 bar)
3C	9 lbs. (4 kg)	275 psig (19 bar)
4C	17 lbs. (8 kg)	275 psig (19 bar)
1D	3 lbs. (1.5 kg)	720 psig (50 bar)
9D	6 lbs. (2.7 kg)	720 psig (50 bar)
2D	8 lbs. (3.6 kg)	720 psig (50 bar)
3D	16 lbs. (7.5 kg)	720 psig (50 bar)
4D	27 lbs. (12.5 kg)	720 psig (50 bar)

Notes

1. Standard pressure rating: 2000 psi @ 70°F.

RF Capacitance Level Controls

Please use the data sheet below to provide SOR with specific details of your application. This will allow us to help you select the proper model to ensure optimum performance.

General	Tag Number		Company
	Application	<input type="radio"/> Level/ <input type="radio"/> Interface	Address
	Function		
	Area Classification	<input type="radio"/> Hazardous/ <input type="radio"/> Non-Hazardous	
	Agency Approval		
Sensor	Probe Model		Contact Name
	Orientation	<input type="radio"/> Vertical/ <input type="radio"/> Horizontal	Phone
	Style		Fax
	Process Wetted Materials		E-mail
	Insertion (in/cm)	_____ <input type="radio"/> in/ <input type="radio"/> cm	Rep Company
	Process Connection Size		Rep Contact
Control	Location	<input type="radio"/> Integral/ <input type="radio"/> Remote	SKETCH APPLICATION HERE Please indicate mounting location as well as other connections and internal obstructions.
	Enclosure Class		
	Conduit Connection		
Switch	Electronics Model		
	Power Supply		
	No. of Setpoints
